Stop seeing this ad Why this ad?

Data discretization converts a large number of data values into smaller ones, so that data evaluation and data management becomes very easy.

### Data discretization example

we have an attribute of age with the following values.

|     |  |
|-----|--|
| Age | 10,11,13,14,17,19,30, 31, 32, 38, 40, 42,70 , 72, 73, 75 |
|-----|--|

Table: Before discretization

| Attribute            | Age                | Age                    | Age             |
|----------------------|--------------------|------------------------|-----------------|
|                      | 10,11,13,14,17,19, | 30, 31, 32, 38, 40, 42 | 70 , 72, 73, 75 |
| After Discretization | Young              | Mature                 | Old             |

Another example is the Website visitor's data. As seen in the figure below, data is discretized into the countries.
